

PNEUMATIC/MECHANICAL DROSS GRAB

- Heavy duty design
- Stainless Steel / Mild Steel construction
- No "Forced" closure - will not damage lost parts of bucket
- Ideal for use with deep kettles
- The best solution with enclosures

The dross grab is fabricated in stabilized stainless steel sized to suit your galvanizing kettle dimensions. The two grab flaps are perforated with suitable sized holes to allow free molten zinc to run back into the bath.

All parts submerged into the zinc will be fabricated with welding rods suitable for use with stainless steel in order to withstand the zinc erosion.

We include for a single point lift only, and so do not allow for any steelwork i.e. arrestor hooks or unloading frame to retain the head fabrication whilst emptying the dross, but can quote for these if required.

The grab is supplied in self-colour, and will require minimal maintenance with periodic inspection of the bucket hinge pins for natural wear.
